

STARS OVER FROSTWOOD

A FREE PRINTABLE SAMPLE • WITH ANSWERS

WHAT'S INSIDE

- How to play Star Battle
- Four Easy puzzles (No. 1 to 4)
- Two Medium puzzles (No. 41 and 42) and one Hard two-star puzzle (No. 81)
- Answer pages (they also show a few puzzles not in this sample)

HOW TO PRINT

- US Letter paper, portrait.
- Choose “Actual size” or “Fit”.
- Grab a pencil and an eraser.
- Answers are at the back. No peeking!

ENJOYED THESE PUZZLES?

The full book, Stars over Frostwood, is a paperback on Amazon.
Search Amazon for “Stars over Frostwood Blake La Pierre”.

BEFORE THE SKY CLEARS

HOW TO PLAY

Each puzzle is a patch of night sky, drawn as a square grid divided by thick lines into **regions**. Your job is to put stars in some of the squares, following three rules:

- * Every **row** and every **column** holds the same number of stars: **one star** in Parts One and Two, **two stars** in Parts Three and Four. The number is printed above each puzzle.
- * Every **region** (the areas outlined by thick lines) holds that same number of stars.
- * Stars **never touch**: no two stars may be in neighbouring squares, not even diagonally.

Useful Tricks

- * **Mark the empties.** Put a small dot in every square that cannot hold a star. When you place a star, dot its eight neighbours, and when a row, column or region has all its stars, dot the rest of it.
- * **Last squares standing.** When a row, column or region has only as many open squares as the stars it still needs, they are all stars.
- * **Small regions first.** List the ways a small region (or a nearly full row) can still hold its stars. A square that every way uses is a star; a square that every way touches is empty.
- * **Squeezed regions.** If a region's open squares all lie in one row, that region's star is that row's star, so the rest of the row is empty. The same goes for columns, and in reverse (a row whose open squares all lie in one region).
- * **Counting across several regions.** If two regions fit entirely inside two rows (in two-star puzzles: they need four stars and the two rows hold four), every other square in those two rows is empty. It works for three regions in three rows, and so on.
- * **What if?** In the Expert puzzles, you may have to suppose a square holds a star, follow the consequences, and see a row or region run out of room. Then you know that square is empty.
